

ASSIGNMENT 1

TASK 1:

The screenshot shows the Visual Studio Code editor with a Python file named `ai assisted 1.py`. The code is a factorial calculator that handles negative numbers, zero, and positive integers. A syntax error is present on line 11: `print(f"The factorial of {num} is {factorial}.")`. The error message in the terminal states: `SyntaxError: unterminated f-string literal (detected at line 11)`. The AI chat window on the right provides a corrected version of the code, which uses `print(f"The factorial of {num} is {factorial}.")` instead of `print(f"The factorial of {num} is {factorial}.)`. The terminal output shows the program running successfully after the correction, displaying `The factorial of 5 is 120.`

```
1 num = int(input("Enter a number: "))
2 factorial = 1
3
4 if num < 0:
5     print("Factorial does not exist for negative numbers.")
6 elif num == 0:
7     print("The factorial of 0 is 1.")
8 else:
9     for i in range(1, num + 1):
10         factorial *= i
11     print(f"The factorial of {num} is {factorial}.)")
```

Terminal Output:

```
PS C:\2403a52117 WTMP> & "C:\Users\SHARATH CHANDRA\AppData\Local\Programs\Python\Python313\python.exe" "c:/2403a52117 WTMP/AI Assisted coding/ai assisted 1.py"
File "c:/2403a52117 WTMP/AI Assisted coding/ai assisted 1.py", line 11
    print(f"The factorial of {num} is {factorial}.)")
                                     ^
SyntaxError: unterminated f-string literal (detected at line 11)
PS C:\2403a52117 WTMP> & "C:\Users\SHARATH CHANDRA\AppData\Local\Programs\Python\Python313\python.exe" "c:/2403a52117 WTMP/AI Assisted coding/ai assisted 1.py"
Enter a number: 5
The factorial of 5 is 120.
PS C:\2403a52117 WTMP>
```

TASK 3:

The screenshot shows the same Visual Studio Code editor with the Python file `ai assisted 1.py`. The AI chat window on the right is now providing a line-by-line explanation of the code. The explanation covers the input handling, the initialization of the factorial variable, the conditional checks for negative numbers and zero, and the loop for calculating the factorial of positive integers. The terminal output remains the same as in Task 1, showing the program running successfully and displaying `The factorial of 5 is 120.`

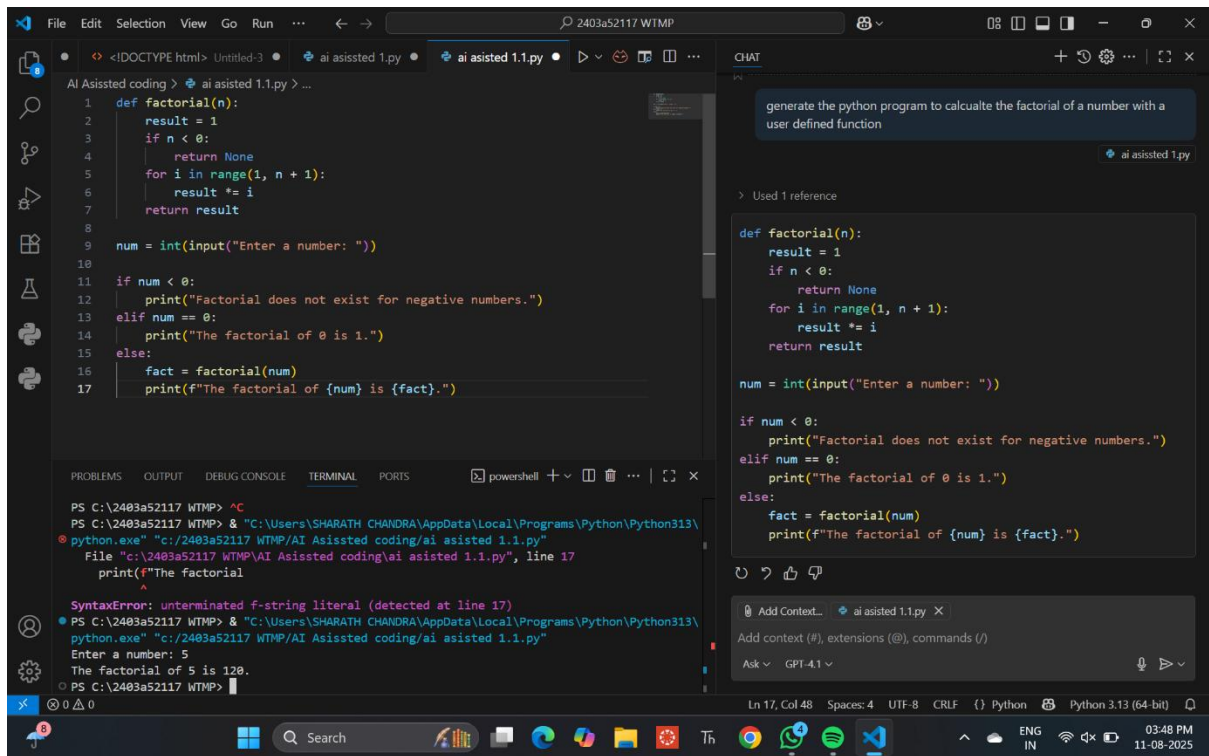

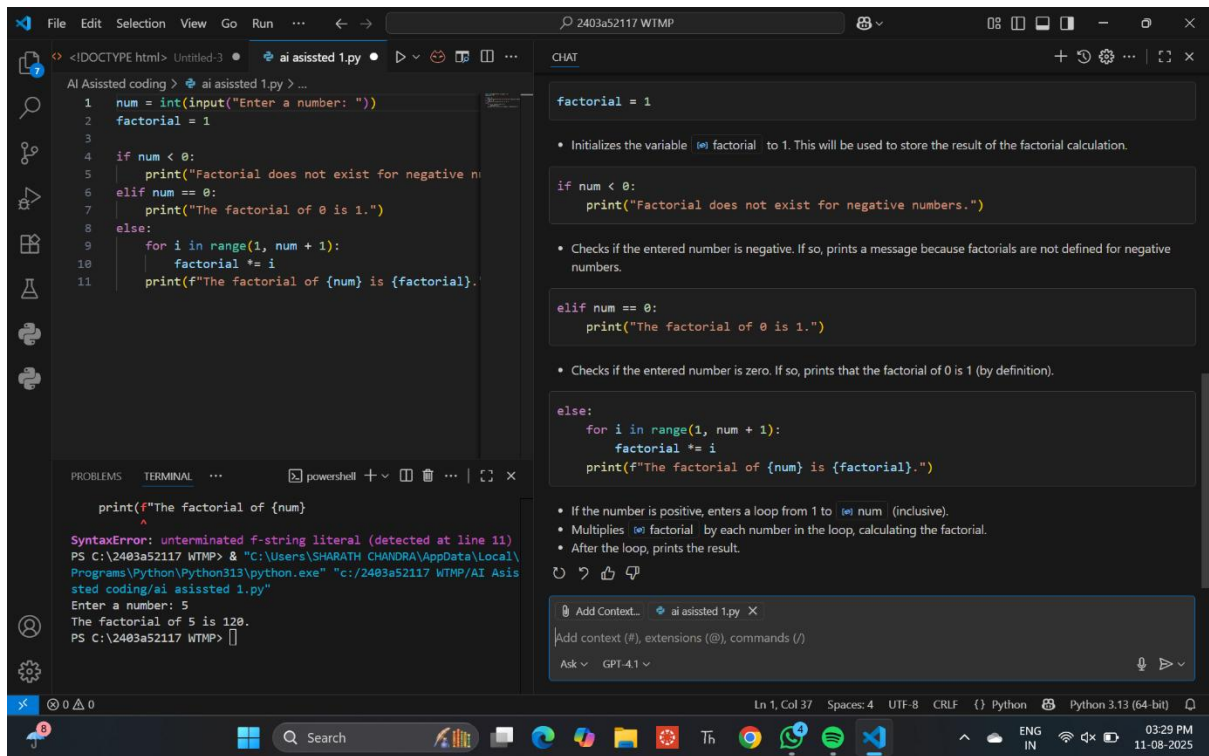

```
1 num = int(input("Enter a number: "))
2 factorial = 1
3
4 if num < 0:
5     print("Factorial does not exist for negative numbers.")
6 elif num == 0:
7     print("The factorial of 0 is 1.")
8 else:
9     for i in range(1, num + 1):
10         factorial *= i
11     print(f"The factorial of {num} is {factorial}.")
```

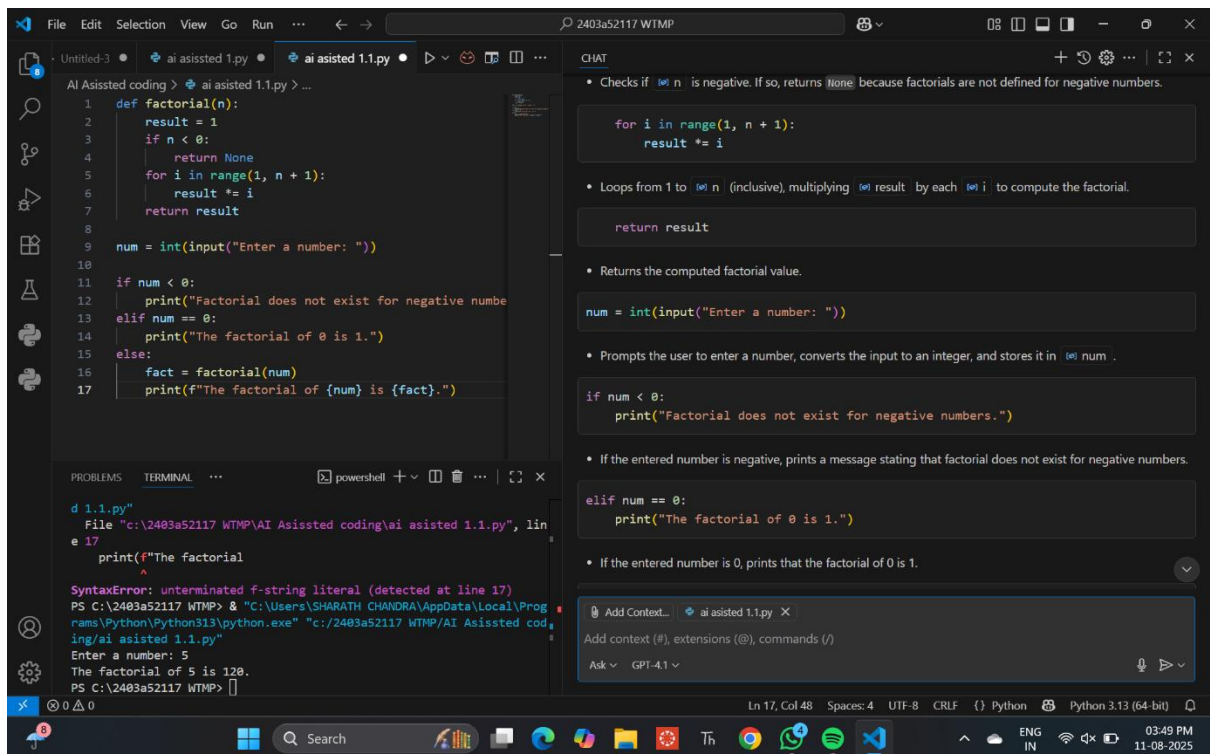

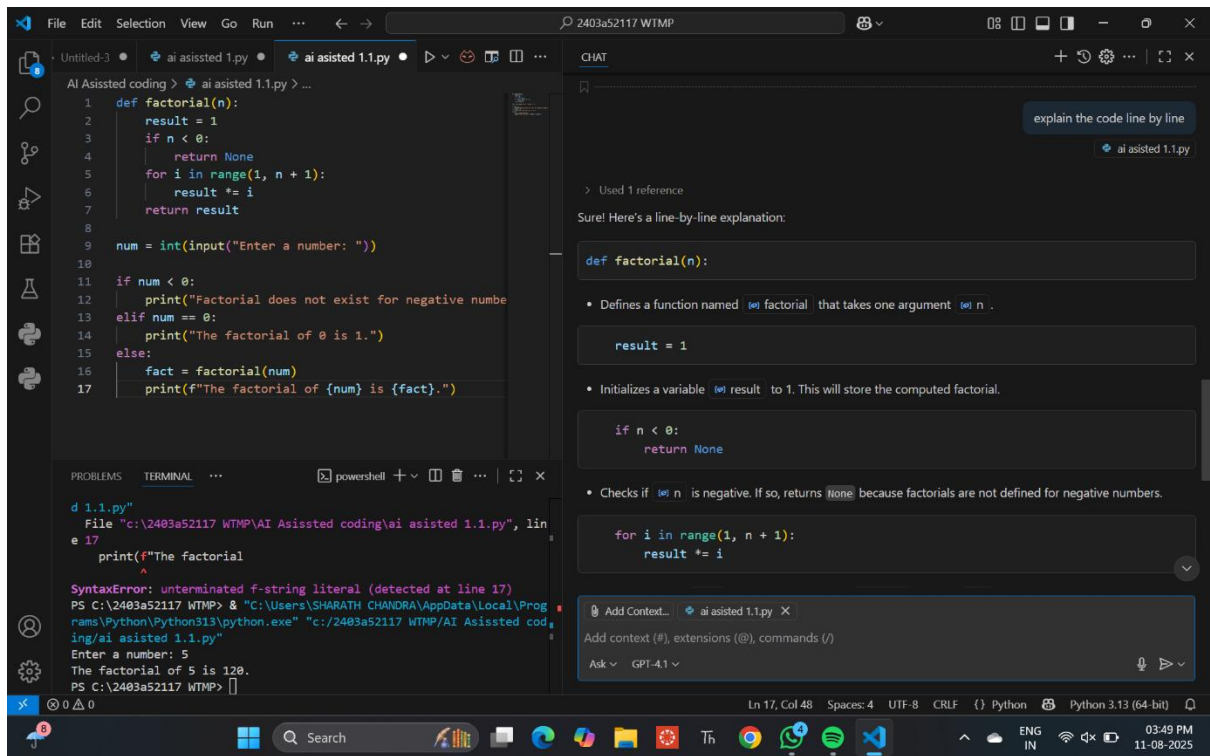

AI Chat Explanation:

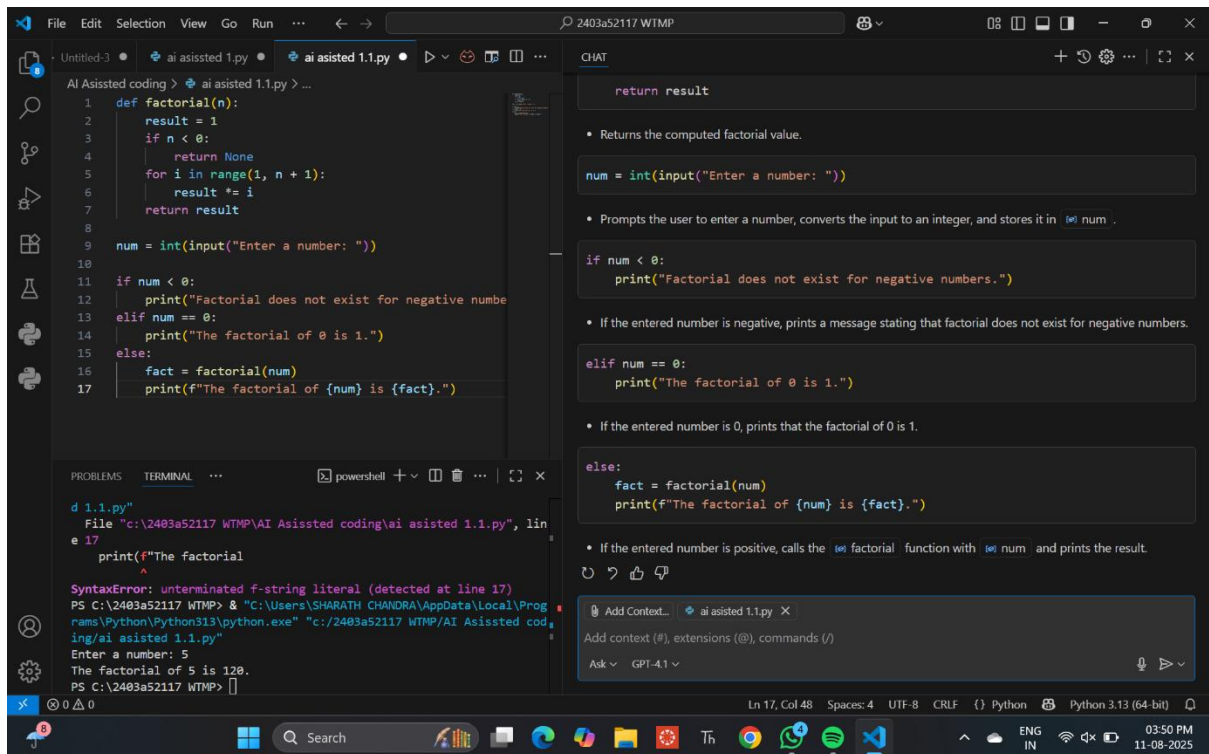

- Prompts the user to enter a number, reads the input as a string, converts it to an integer, and stores it in the variable `num`.
- Initializes the variable `factorial` to 1. This will be used to store the result of the factorial calculation.
- Checks if the entered number is negative. If so, prints a message because factorials are not defined for negative numbers.

Terminal Output:

```
PS C:\2403a52117 WTMP> & "C:\Users\SHARATH CHANDRA\AppData\Local\Programs\Python\Python313\python.exe" "c:/2403a52117 WTMP/AI Assisted coding/ai assisted 1.py"
Enter a number: 5
The factorial of 5 is 120.
PS C:\2403a52117 WTMP>
```

TASK 5:
